DRAFT

76

## 0. Introduction

77

This document defines a Reference Architecture – a commonly-understood organization of components for implementing mobile handsets. The purpose of a reference architecture is to define a standard vocabulary for talking about products in a domain. A practitioner should recognize the components and the organization of the components of typical handsets as variations on such a reference architecture. The purpose of this Reference Architecture is explanatory rather than constraining. Typical products will have implementation architectures that modify or extend this architecture in various ways.

83

The Architecture presented in this document is based on an architecture that was originally the collaborative work of NEC Corporation, Panasonic Mobile Communication Ltd., and NTT DoCoMo, Inc.

85

Chapter 1 is an overview of the domain, characterizing different product tiers.

86

The basic architecture is described in chapter 2

87

The functions of each component of the architecture are described in chapter 3.

88

The data and control flows between components during typical use cases are described in chapter 4.

89

### 0.1 Scope

90

This document defines the reference architecture of Linux based mobile phone. This is a non-normative part of the Specification. The goal of the Reference Architecture is to provide the context for the descriptions in the normative parts of the Specification.

93

The Reference Architecture does not describe the internal architecture of the communication protocol stack or the Application Framework.

95

### 0.2 Vocabulary and Abbreviations

96

See the corresponding section in the Preface document.

97

### 0.3 References

98

[Preface] <provide reference to the Preface document>

99

[CS] <provide reference to the Circuit-Switched Communication Service section>

100

[PS] <provide reference to the Packet-Switched Communication Service section>

102

# 1. The Mobile Phone Domain

103

It is customary in the mobile handset industry to describe phones as falling into different “tiers,” broad classes of phones with common characteristics – feature set, price, display size, etc. Because different tiers have different performance, price, and feature requirements, they will often be implemented by different software and hardware architectures.

107

Table 1 gives working definitions of a set of Reference Tiers. Note that these represent a particular point in time (end-of 2004) and some of the details of specific areas will change as technology changes. Many products do not fit neatly into one niche and will blend characteristics of different tiers. Also, many products will add features not covered by this table.

111

The Reference Architecture corresponds broadly to the “Smart Phone” and “Multimedia Phone” tiers in this table. The differences between those tiers are typically in the application of the architecture (the way it is used) and in the details of the components and the physical characteristics of the device. This architecture could be used for the lower tiers (“Feature Phone” and “Plain-Old Mobile”), but would include capabilities and performance enablers that would probably make such application economically inappropriate.

116

However, as component costs decrease and their performance increases, it might become practical to use this architecture more broadly; the economies of scale resulting from reusable components might offset the hardware costs.

118

	Tier			
Aspect	Smart Phone	Multimedia Phone	Feature Phone	Plain-Old Mobile
Focus	business focus	Personal/Entertainment Focus	Lifestyle Focus (voice plus social networking support features)	Voice
Primary Functionality	Full PDA functionality (Calendaring, address book)	Strong PIM support, personal content management features	Minimal PIM functionality (phonebook, datebook)	Phonebook and call logs
Extensibility	Extensible (downloadable features)	Limited extensibility (MIDlets or BREW)	Limited extensibility (MIDlets/BREW)	No extensibility
Multimedia	Optional	Vido capture support, Media/content players, stereo	Limited multimedia support (pictures, MP3, MIDI, Simple, low-frame-rate animations)	None
DRM	Optional	Multiple DRM schemes	Hard DRM (limits on copying any media of given types)	None
Camera	Optional	2-3 megapixel camera	VGA camera or no camera	No camera
Browser	XHTML Browser	XHTML Browser	WAP Browser (text-centric)	Embedded access to

				specific URLs
<b>Display</b>	QVGA or larger color display	QSIF or larger color display	QSIF or smaller color display	Small display (64x96), non-color
<b>Interaction</b>	Touchscreen UI or QWERTY keyboard plus pointing device	Specialized keypad for media/game interaction	Standard keypad plus carrier-specific keys	Standard keypad
<b>Connectivity</b>	3G connectivity, possibly WLAN, Bluetooth, IrDA	2.5G or 3G connectivity, possibly WLAN; High-speed USB; Bluetooth	2G connectivity; USB or serial cable	2G connectivity; proprietary accessory cable
<b>Memory</b>	32M RAM, 64M ROM, removable storage	64M RAM, 64M ROM, Hard Disk or large removable storage	16M RAM, 16M ROM, no removable storage	8M RAM, 8M ROM or less
<b>Processor</b>	120MHz	200MHz	30MHz	15MHz

119

120

## 2. Architecture

121

This document describes a reference architecture for mobile phones based on the Linux operating system.

122

Any real product would be likely to have an implementation architecture that modifies or extends this

123

reference architecture.

124

The architecture separates processing between two domains: the application domain and the

125

communications domain. The two domains might run on separate processors, as separate processes on a

126

single architecture, as separate virtual processors running over a micro-kernel, or other physical

127

implementation. The Communications domain would include all activities requiring hard real-time

128

behaviour.

129

Figure 1 is a top-level view of the architecture. Note that while the layering between the large boxes is

130

meant to be strict (for instance, Applications interact with the Kernel only through Middleware

131

components, not directly). The horizontal arrangement is arbitrary.

132

The Reference Architecture identifies this partitioning of processing domains but does not dictate the

133

physical realization used. In Figure 1, the Bridge represents whatever mechanism is used in the particular

134

realization to support interaction between the domains. The implementation of the Bridge is not in the

135

scope of the Reference Architecture.

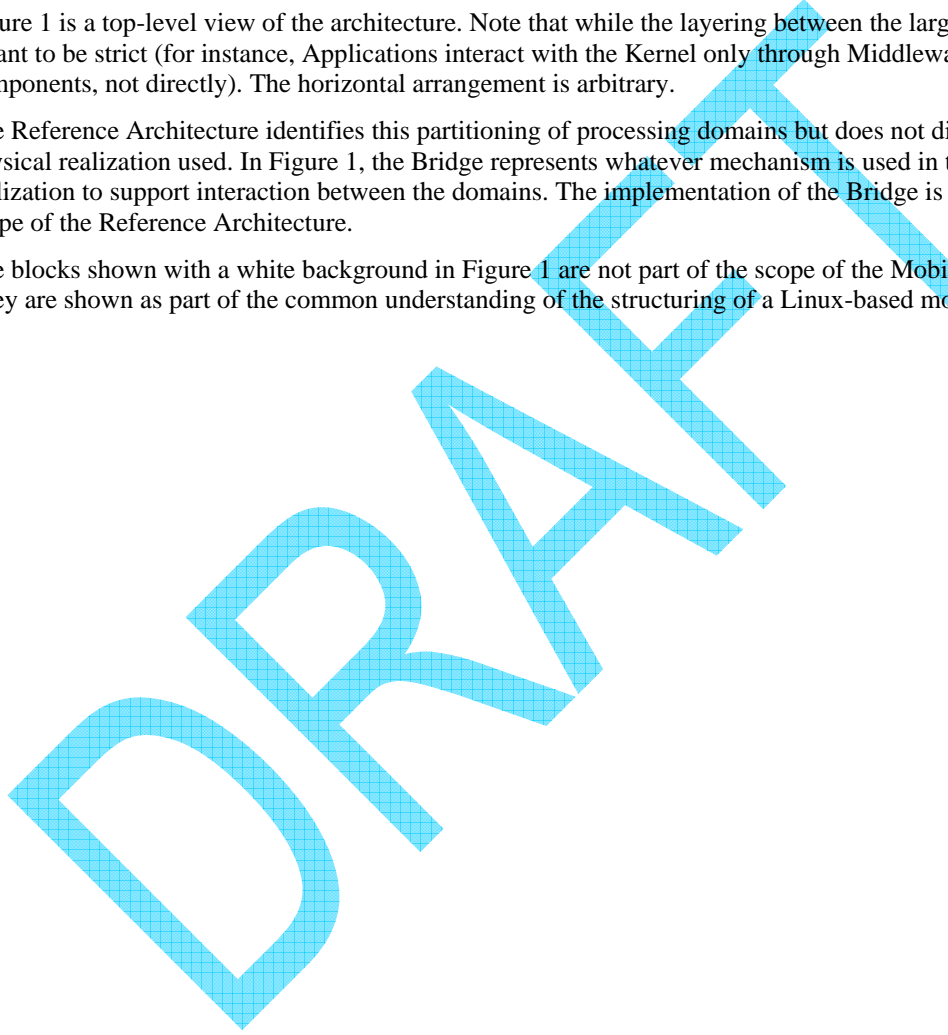

136

The blocks shown with a white background in Figure 1 are not part of the scope of the Mobile Phone API.

137

They are shown as part of the common understanding of the structuring of a Linux-based mobile phone.

138

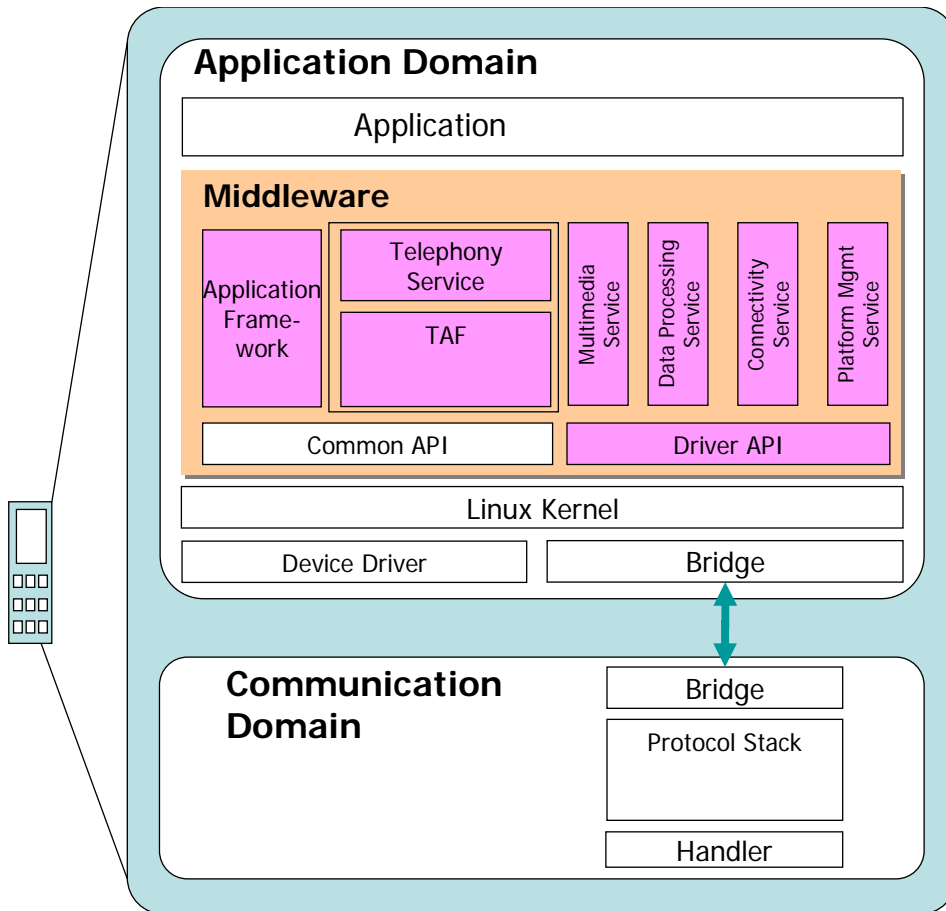

Figure 1 Overall Architecture

## 2.1 Applications Domain

The software running in the Application Domain contains the following 4 layers:

Application

Middleware

Linux kernel

Driver & Bridge

### 2.1.1 Application layer

The application layer contains various applications. They are classified into the following 8 categories; samples are listed to illustrate the categorization, but are not meant either to be requirements or to be a complete list of the applications in a given category:

#### 2.1.1.1 Telephony applications

Telephony applications include Standby Screen (Idle), main menu, videophone application, phone applications, phonebook and other Personal Information Management (PIM) applications, and phone personalization settings.

156 **2.1.1.2 System applications**

157 System applications include Air download, Generic LCD display, Backside LCD display, PIN  
158 authentication and monitor mode, other function setup, Equipment alarm, etc.

159 **2.1.1.3 Multimedia applications**

160 Multimedia applications include still image viewer, video viewer, camera app, vector graphics viewer,  
161 avatar and ring tone management.

162 **2.1.1.4 Data-processing applications**

163 Data-processing applications include OCR, barcode, SD-PIM, data transfer, memory transfer, external I/F  
164 communication, user data, IR, schedule, voice memo, schedule alarm, and data folder.

165 **2.1.1.5 Internet-applications**

166 Internet applications are those that use TCP/IP to access resources on the internet, including e-mail,  
167 Browser, HTML mailer, etc.

168 **2.1.1.6 Internet Application Engine**

169 Internet application engines are application-level services that would be used by applications that include  
170 internet-enabled functions; examples include engines for HTTP, SSL, embedded languages, etc.

171 **2.1.1.7 Java Application Engine**

172 The Java applications engine includes a Java Virtual Machine (JVM), Java Application Manager (JAM),  
173 and class libraries.

174 **2.1.1.8 Others**

175 Others includes Accessory menu, Accessories (text memo, calculator etc.), etc..

176 **2.1.2 Middleware layer**

177 Middleware layer contains the following components.

178 **2.1.2.1 Applications framework**

179 The Applications framework provides application developers with a common framework of services  
180 commonly used by mobile-phone applications.

181 **2.1.2.2 Telephony service**

182 The telephony service provides application developers with a framework of services for communications  
183 and handset management.

184 **2.1.2.3 Multimedia service**

185 The multimedia service provides video phone service (H324, for example), and multimedia decoding,  
186 encoding, and rendering facilities.

187 **2.1.2.4 Data processing service**

188 The data-processing service supports processing the data from various devices, e.g., bar-code reader,  
189 optical character reader, etc.

190 **2.1.2.5 Platform Management service**

191 The Platform Management Service provides the functions of system management, including installation of  
192 software and control of system processes.

193 **2.1.2.6 Connectivity Service**

194 The Connectivity Service handles inter-device functions, such as synchronization and OBEX data  
195 exchange.

196 **2.1.2.7 TAF (Terminal Adaptation Function)**

197 The provides the back-end services needed by the Telephony Service APIs. It mediates between the phone  
198 software's model of network programming and the specifics needed for the particular networks supported  
199 by a specific handset.

200 **2.1.2.8 Common API**

201 The Common API provides application developers with standard C-language functions, including standard  
202 libraries and system calls.

203 **2.1.2.9 Driver API**

204 The device-driver API provides middleware and application programs access to devices and to services  
205 modeled as devices.

206 **2.1.3 Kernel/Driver layer**

207 **2.1.3.1 Kernel and Device Drivers**

208 The Kernel / Driver layer contains the Linux Kernel and device drivers and the Application-Domain end of  
209 the Bridge.

210 **2.1.3.2 Bridge**

211 The Bridge supports communication between the Application and Communication domains, which may be  
212 implemented as separate processors or not, but will minimally have different scheduling regimes.

213 **2.2 Communications Domain**

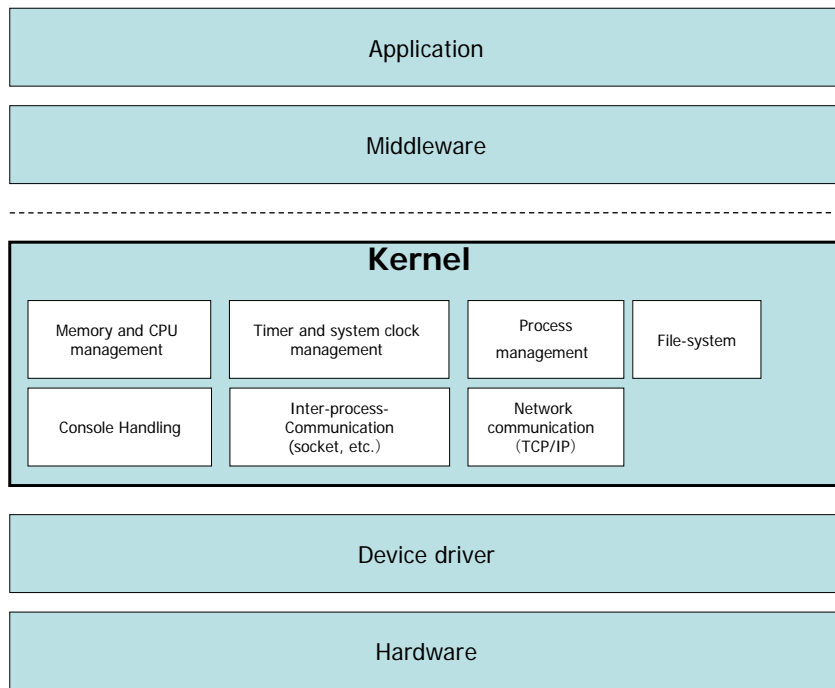

214 The Communications Domain performs all processing that requires hard real-time behaviour, including  
215 executing the lower levels of the protocol between the device and the network. Its protocol stack contains  
216 the network stack's L1, L2, L3 layers. The Bridge supports communication with the Applications Domain.

## 217 3. Description of functional entities

### 218 3.1 Linux Kernel

219 The Linux Kernel provides:

- 220 • Memory and CPU management
- 221 • Timer and system clock management
- 222 • Process management: create, destroy and dispatch
- 223 • File-systems: files, directories, and space management
- 224 • Console handling
- 225 • Inter-process-communication: sockets, message queues, shared memory, etc.
- 226 • Network communication: TCP/IP

227

228

Figure 2 Linux Kernel

### 229 3.2 Common API

230 The Common API contains various functions for applications to use, including the standard C libraries. The  
231 Common APIs conform to the POSIX standard.

### 232 3.3 Application Framework

233 Fig-3 is an overview of the application framework. This is an area where variation is common in the  
234 domain, with the specific requirements of the application set and the UI framework chosen for specific  
235 products potentially differing from this reference architecture, Usually, however, the functional separation

236 is similar to this.

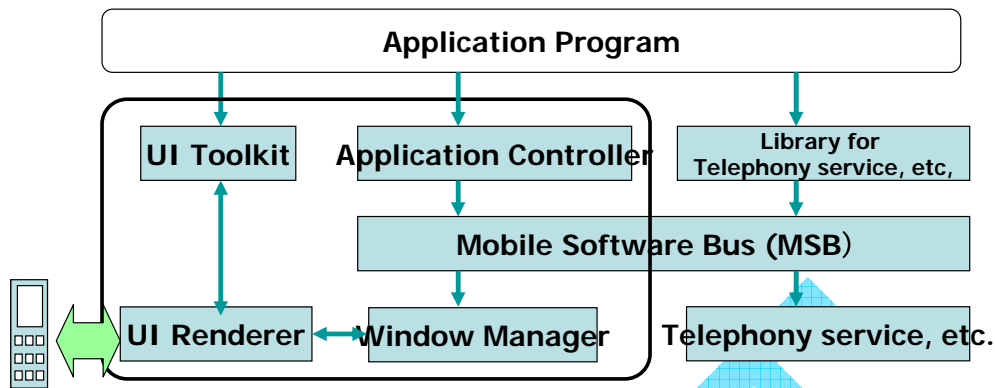

Figure 3 AP Framework

237

### 238 3.3.1 Window Manager

239 The Window Manager provides unified operation and decoration for windows and controls overlap of  
240 windows (clipping and layering).

241 In the Application framework for mobile-phone, window manager provides:

242 Foreground and background control of application window

243 Tracking the state of applications (active, inactive, idle, not-started)

### 244 3.3.2 Application Controller (APC)

245 The APC controls the start and end of applications. That is, starts applications, switches between  
246 applications, and shuts down applications at power-off. APC also manages application start status, and  
247 controls application switching operation (e.g., selection of an application to be next used as a foreground  
248 application at application switching).

249 The Window Manager controls window stacking, focusing, and properties for each group during the period  
250 from window generation to deletion. The Window Manager receives requests from the APC library through  
251 the Event Bus and resolves contention between applications, according to the priority table based on the  
252 application status. It also control windows overlapping and key focusing.

253 The Application Controller uses the Event Bus to communicate between applications and the Window  
254 Manager.

### 255 3.3.3 UI Toolkit

256 The UI Toolkit is a set of functions and facilities for the application to use to present and manage  
257 interaction with the user.

### 258 3.3.4 UI Renderer

259 The UI renderer controls presentation of the interaction elements on the display(s).

### 260 3.3.5 Event Bus

261 The Event Bus is a framework for passing messages between entities. It supplies communication services  
262 (synchronous and asynchronous communication) between applications and services. Different  
263 implementations of the reference architecture may use different kinds of inter-process communication for

264 this role. See [Preface] for more information about the programming model and the portion of the Event  
 265 Bus semantics that are visible in the APIs.

### 266 3.3.6 Others

#### 267 3.3.6.1 PICT (PICTograph) display library

268 It controls turning on/off of the upper pictograph elements such as antenna and battery.

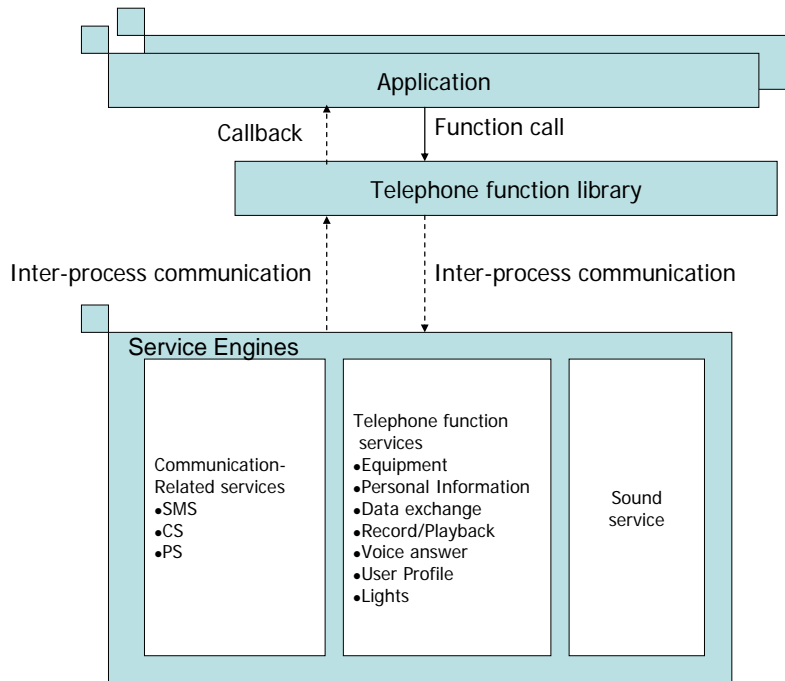

#### 269 3.3.6.2 Image library

270 It Converts, extracts, or compresses image data, aoes used to set or acquire image information.

## 271 3.4 Telephony Service

272 Fig-4 describes the telephony processing framework. The Telephony Service provides abstract (not specific  
 273 to the network technology or the handset hardware) APIs for applications to use to access the functions of  
 274 the handset, including both communications services and control of the typical range of equipment features.

275 The architecture separates the interfaces to the various function-specific services from their  
 276 implementations. A specific implementation architecture might choose to make this a deployment  
 277 separation, as shown in Figure 4, or might choose to bundle them within a library implementation.

278  
 279 **Figure 4 Telephony Processing**

### 280 3.4.1 Circuit-Switched (Voice) Communication service

281 The Circuit-Switched Communication (CS) service provides application programs with abstract APIs for  
 282 dialing, call disconnection, rejecting incoming calls, etc., for voice and video communications. This API is  
 283 available as [CS].

### 284 3.4.2 Packet-Switched (Data) Communication service

285 The Packet-Switched Communication (PS) service provides application programs with abstract APIs for  
 286 initiating and terminating sessions and connections, rejecting incoming calls, etc., for data communications.  
 287 This API is available as [PS].

288 **3.4.3 SMS Communication service**

289 The SMS Communication service provides application programs with abstract APIs for sending and  
290 receiving SMS messages, receiving notification of events, and checking the status of the SMS service, etc..

291 **3.4.4 Equipment service**

292 The Equipment service provides APIs for programs to set up, control, and read the status of various handset  
293 hardware elements (batteries, headsets, etc.).

294 **3.4.5 Personal Information Manager service**

295 PIM provides APIs for programs to register a schedule (calendar), sort the schedule data, read to-do data,  
296 etc.

297 **3.4.6 Data Exchange service**

298 The Data Exchange service provides APIs for programs to handle phone-book, memo, image, and video,  
299 etc. on internal and removable memory stores.

300 **3.4.7 Record and Playback service**

301 Record and Playback provides application programs with record and playback of voice memo.

302 **3.4.8 Light Management service**

303 The Light Management service provides APIs for programs to for control various lights.

304 **3.4.9 Sound service**

305 The Sound service provides abstract APIs for functions to play and manage ring-tones and other sounds.

306 **3.4.10 User Profile library**

307 The User Profile library provides application programs with the ability to read and set various attributes of  
308 the user's profile, such as registered phone numbers, owner name, and e-mail addresses.

309 **3.5 Multimedia Service**

310 Fig-5 describes the multimedia service.

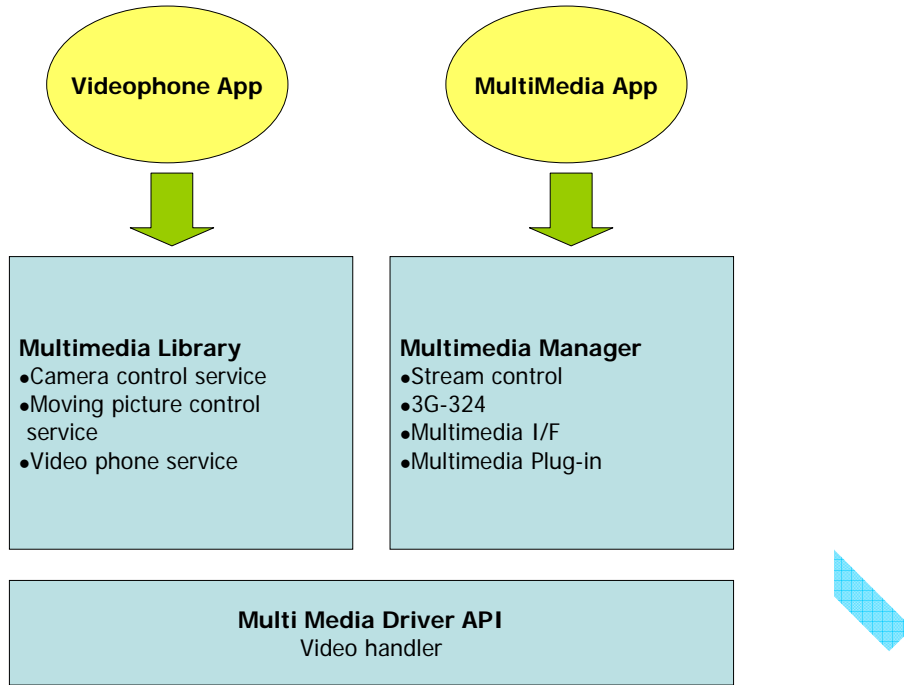

Figure 5 Multimedia Framework

### 3.5.1 Multimedia Manager

The Multimedia Manager provides interfaces for interconnecting multimedia functions, such as video phone library, 3G-H324M protocol support, camera control library, and moving picture control library.

### 3.5.2 Multimedia Library

The Multimedia Library provides interfaces for camera control, moving picture control, and video phone services.

### 3.5.3 Multimedia Driver API

Multimedia Driver API provides video handler interfaces.

## 3.6 Data Processing

This block covers various kinds of add-on functionality related to dealing with external data

### 3.6.1 Bar Code Library

It provides the bar code reader functions.

### 3.6.2 OCR Library

It provides the OCR access reader functions.

### 3.6.3 Location Services

This provides access to the geographical location of the phone and events related to recognizing specific locations, for phones equipped with the appropriate capabilities.

### 330 **3.7 Connectivity Service**

331 The OBEX (object exchange) module supports synchronization and sharing of information between  
332 devices by exchange of data objects. It provides an interface that is used by OBEX to perform  
333 communication processing based on request messages from application programs and to return processing  
334 results to the application programs. It also provides an interface that is used by OBEX to convert objects to  
335 canonical format for interchange.

### 336 **3.8 Platform Management Service**

337 The Platform Management monitors the activation of each task at the time of power on and the deactivation  
338 of each task at the time of power off, as well as the charging and other statuses of the mobile terminal.

### 339 **3.9 Terminal Adaptation Function (TAF)**

340 The TAF is the interface between the phone software's networking functionality (voice and data) and the  
341 network protocols that are used over the connected network(s); it is the entity that actually constructs  
342 sessions and connections in response to abstract requests from clients, adapting a generic view of  
343 connections to the specific interactions needed for a particular network.

344 Applications do not use the TAF API directly; they use it only through the APIs provided by the Telephony  
345 Service.

### 346 **3.10 Driver API**

347 The Driver API provides upper layer components (middleware and application programs) an abstract  
348 interface to device drivers, so that device-independent components do not need to be aware of the particular  
349 device drivers available on a specific handset, hardware-specific ioctls, etc. This avoids hardware  
350 dependencies, enabling development of portable middleware and application programs for mobile phones.

351

## 4. Data Flows

352

This section describes data and control flow between components of the architecture in various domains.

353

### 4.1 Voice communication

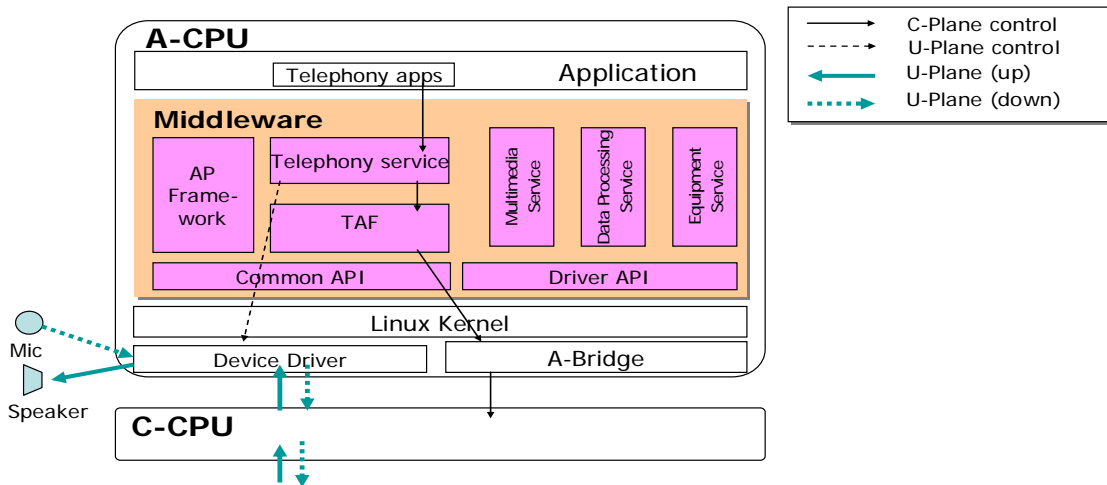

354

Telephony application controls the C-plane using the telephony service. This figure shows the flows for a mobile-originated call; for a mobile-terminated call there would also be a

355

356

Voice data is decoded by a protocol-specific codec and sent to the appropriate audio output.

357

358

359

Figure 6 Voice Communication

360

### 4.2 Video phone

361

Video phone application program controls C-Plane by telephony service.

362

Multimedia service provide decoding and encoding facilities to support video telephony, such as H.324.

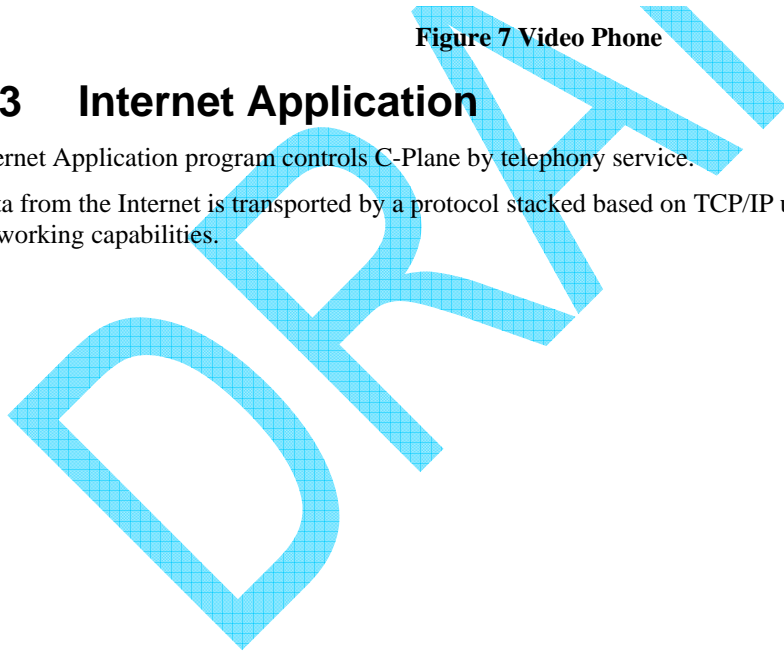

Figure 7 Video Phone

### 4.3 Internet Application

Internet Application program controls C-Plane by telephony service.

Data from the Internet is transported by a protocol stacked based on TCP/IP using the Linux Kernel networking capabilities.
